

## mydefichain Masternode Service. Let's make DeFiChain decentralized

You need:

A functional DeFi Wallet with Windows, Mac oder Linux and 20.011 UTXO-DFI.

1. Unlock your wallet fort the maximum time
2. Check your UTXO-Balance:
  - a. With Walletversion 2.3.5 and newer you can see it in your Overview.

- b. Alternative: open the CLI and type `getbalances`

```
Console

DeFi Wallet v2.5.2
Node v1.7.11
}getbalance
15.66174485
}
```

3. If most of DFI are Tokens and not UTXO (e.g. if your DFI come as reward from liquidity mining), you have to convert them to UTXO. To do this you send a small amount more as in the display of UTXO or `getbalance` to your own address. So in the above case e.g. 16 DFI to yourself. This converts all DFI tokens into UTXO-DFI.
4. Create a Legacyaddress. DFI Wallet -> Receive -> + New Address -> Show Advanced Options -> Legacy -> Enter Address Label -> Create
5. Get a Operatoraddress from mydefichain (Telegram <https://t.me/mydefichain> or <https://defichain-explained.com/produkt/masternode-service/> )

← BACK

### Create new receive address

Automatically generate a new address

Address label  
Masternode01

Give your new DFI address a meaningful label

Show advance options ▾

Address type  Default  Legacy

From mydefichain Addresspool

Console

```
DeFi Wallet v2.5.2
Node v1.7.11
>createmasternode 8MbHKN4XFKWCjxmebYzchCzM7Xo5ugBca 8MbHKjjudzdzZghGgtfTthjj65TgFDi
```

6. Switch to CLI and type:

For unlocked Masternode:

createmasternode YOUROWNERADDRESS OUROPERATORADDRESS

For 5 Year locked Masternode:

createmasternode YOUROWNERADDRESS OUROPERATORADDRESS [ ] FIVEYEARTIMELOCK

For 10 Year locked Masternode:

createmasternode YOUROWNERADDRESS OUROPERATORADDRESS [ ] TENYEARTIMELOCK

As a result you get the Transaction-ID, in which your Masternode was ENABLED.

Check <https://mydeficha.in/masternodes.php> if your masternode appears after a few minutes up there as PRE\_ENABLED. It takes 1008 blocks, which corresponds to about 8-10h, until your masternode is activated, the staking process will start automatically.

Thats it, congratulation, you don't have to do anything else.

**ATTENTION: Please do not try to set the Masternode in the wallet to ENABLED or ACTIVE, then your wallet will try to start the masternode locally, but it is already running on our VPS.**

Happy Mining!
